New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ligand.

Claim 5; Page 85-90; 119pp; English.

The invention relates to an isolated cytokine receptor polypeptide designated Scytoria Fine Scytoria polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psoriasis of two or growth. The encoding nucleic acids are useful for providing Scytoria in vivo by gene therapy techniques. Ecytoria oligonucleotide probes are useful for in vivo diagnosis, and the Scytoria probes and primers can be used to detect and localize Scytoria gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which scytoria gene resides. The Scytoria polymucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familia. Euclodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Ecytoria nucleotide sequence.

The invention relates to an isolated cytokine receptor polypeptide designated Zcytor18. The Zcytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psortasis or tumour growth. The encoding nucleic acids are useful for providing Zcytor18 in vivo by gene therapy techniques Zcytor18 oligonucleotide probes are useful for in vivo diagnosis, and the Zcytor18 probes and primers can be used to detect and localize Zcytor18 gene expression in tissue samples. The probes are also useful for the vivo diagnosis, and the Zcytor18 probes and primers can be used to detect and localize Zcytor18 gene expression in tissue samples. The probes are linkage-based testing of pulmonary alveolar proteinosis, familial linkage-based testing of pulmonary alveolar proteinosis, familial polymorphisms of cytokine receptors. The present sequence represents a human Zcytor18 variant nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ð
                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated cytokine receptor polypeptide designated Ecytori8. The Ecytori8 polypeptides can be used to inhibit cell proliferation associated with polypeptides can be used to inhibit cell proliferation associated with polypeptides can be used to inhibit encombinant methodology. The polypeptides can be used to inhibit encoding nucleic acids are useful for providing Ecytori8 in vivo by gene therapy techniques Ecytori8 oligonucleotide probes are useful for in vivo diagnosis, and the Ecytori8 probes and primers can be used to detect and localize Ecytori8 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in Ecytories and in which Ecytorie gene resides. The Ecytorie polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial linkage-based testing of pulmonary alveolar proteinosis, familial polymorphisms of cytokine receptors. The present sequence represents a human Ecytorie spilor ever and erythic ever and erythic ever mucleotide sequence.
                                                                                                                                                                                                                                                   New cytokine receptor polypeptide designated zcytori8, useful for an inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GGCCTGGCTGGGCGAGCGCACGGCCATGGCCCCGTGGCTGCAGCTCTGCTCCGTCTTCTT 120

Isolated antigenic human or mouse DNAX receptor subunit-like polypeptide useful for detecting antibodies generated in response presence of increased protein levels or immunological disorders -

WPI; 2002-106198/14. P-PSDB; AAU11355

Gorman DM;

Claim 16; Page 21-25; 148pp; English.

```
The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polynculectides encoding them. The receptors, or their portions may be useful; as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antipodies capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen. A combination of antiser or antibodies capable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents cDNA encoding the human DCRSB polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel human secreted polypeptide having sequence 90% identical to the polypeptide sequences of LP105, LP661, LP244, LP240, LP234(a), LP243(b), LP243(b), LP243(b), LP243(b), LP233(a), LP243(b), LP253(a), LP244, LP186, LP218), LP251(a), LP252, LP239(b), Also included are the nucleic acids encoding the LP proteins (including complement, fragments encoding mature forms of the polypeptide or variant), a vector comprising the nucleic acid, a host cell comprising the vector, the preparation of the protein, encoding mature forms of the nucleic acid, an anti-LP antibody, aut/agonists of LP and anti-LP-encoding mRNA ribozymes. The secreted protein or its agonist is useful in the manufacture of a medicament for treating a manual suffering from a disease (and in diagnosis), condition or disorder associated with the intition of the secreted protein e.g. cancer, autoimmen disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polypeptides and polynucleotides of secreted proteins useful for treating various diseases such as multiple sclerosis, cancer, autoimmune diseases, osteoporosis, Alzheimer's disease and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Page 166-171; 235pp; English.

The sequence (DNA 154095-2998) encodes a PRO polypeptide (PRO20026)
which is the human Interleukin 17 receptor, IL-17RH4. A composition
containing ant/agonists to the PRO polypeptides or individual components
containing ant/agonists to the PRO polypeptides or individual components
containing ant/agonists to the PRO preptides or individual components
systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,
livenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an
idopathic-inflammatory myopathy. Sjogren's syndrome, systemic
containing arthritis; and emolytic; aneania, autoimmune
clisease, a demyelinating disease, an autoimmune or immune-mediated renal
disease, contact demantitis; an allergic disease or food
hypersensitivity asthma, a transplantation associated disease, or a
chronic inflammatory demyelinating polyneuropathy. Treating a PRO1031 or
degenerative cartilaginous disorder comprises administering a PRO1031 or
PRO1122 polypeptide agonist, or antagonist to the mammal. Numerous
examples of the diseases and disorders are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CCATCAGCCAGTATGCTTGCCATGACCAAGTGGCAGTCACCATTCTTTGGTCCCCAGGGG 431

New cytokine receptor polypeptide designated zcytor18, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytor18 ligand

Claim 7; Page 111-115; 119pp; English.

The invention relates to an isolated cytokine receptor polypeptide designated Ecytor18. The Ecytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psorlasis or tumour growth. The encoding nucleic acids are useful for providing Ecytor18 in vivo by gene therapy techniques. Ecytor18 oligonocleotide probes are useful for invivo diagnosis, and the Ecytor18 probes and Minners can be used to detect and localize Ecytor18 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chicmosome 3 in which Ecytor18 gene resides. The Ecytor18 polypucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial polymorphisms of cytokine receptors. The present sequence represents a murine Ecytor18 nucleotide sequence.

New cytokine/receptor polypeptide designated zcytor18, useful for inhibiting cell proliferation:associated with psoriasis or tumor growth; and modulating immune system by binding to endogenous zcytor18

Disclosure; Page 92-93; 119pp; English.

The invention relates to an isolated cytokine receptor polypeptide designated Scytor18. The Zeytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell'proliferation associated with psortasis or tumour growth. The encoding nucleic acids are useful for providing Zeytor18 in vivo by gene therapy techniques. Ecytor18 oldponucleotide.probes are useful for in vivo diagnosis, and the Zeytor18 probes and primers can be used to detect and localize Zeytor18 gene expression in tissue samples. The probes are also useful for in vivo diagnosis, and the Zeytor18 probes are becaused in which Ecytor18 gene resides. The Zeytor18 probles and charactering in Certor18. Deliminary alveolar proteinosis, familial linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Zeytor18 degenerate coding sequence.

New cytokine receptor polypeptide designated zcytor18, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytor18 ligand -

٠,

Disclosure, Page 101-102; 119pp; English

The invention relates to an isolated cytokine receptor polypeptide designated Ecytoria. The Ecytoria polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with peolasis or tumour growth. The cell proliferation associated with peolasis or tumour growth. The concoding nucleic acids are useful, for providing Ecytoria in vivo by gene therapy, techniques. Ecytoria oligonuclectide probes are useful for in vivo diagnosis, and the Ecytoria probes and primers can be used to detect and localize Ecytoria gines expression. In tissue/samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which inkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The presents a human Ecytoria variant degenerate coding sequence represents a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated cytokine receptor polypeptide designated Zcytor18. The Zcytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psoriasis or tumour growth. The encoding nucleic acids are useful for providing Zcytor18 in vivo by gene
                                                                 2065
                                                                                                                                                                       New cytokine receptor polypeptide designated zcytor18, useful for growthing cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytor18 ligand

therapy techniques. Zcytor18 oligonucleotide probes are useful for in vivo diagnosis, and the Zcytor18 probes and primers can be used to detect and localize Zcytor18 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome. In which Zcytor18 gene resides. The Zcytor18 polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Zcytor18 splice variant degenerate coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GCCAGCAGAAACAGTGGGCTGTACAACATCACCTTCAAATATGACAATTGTACCACCTAC 325

The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polyunclectides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other crytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents human DCRS reverse translation generic cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; DNAX cytokine receptor subunit 8; DCRS8; phosphate labelling; ss; gene therapy; protein therapy; immunological disorder.

New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ligand

Disclosure; Page 118-119; 119pp; English.

The Invention relates to an isolated cytokine receptor polypeptide designated Ecytoria. The Ecytoria polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with polypeptides can be used to inhibit encoding nucleic acids are useful for providing Ecytoria in vivo by gene therapy techniques. Ecytoria oligonucieotide probes are useful for invivo diagnosia, and the Ecytoria probes and primers can be used to detect and localize Ecytoria gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which Ecytoria gene resides. The Ecytoria polyuucieotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a murine Ecytoria degenerate coding sequence. \*\*\*\*\*\*\*\*\*\*\*\*\*

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inappropriate IL-17 receptor like polypeptide (ILI/IIp) expression. These include, for example immune disorders (e.g. inflammation, diabetes and transplant rejection), infections (e.g. hepatitis and septicemia), weight disorders (e.g. anorexia, cachexia and obesity), neuronal dysfunction (e.g. Alzhelmer's disease, Parkinson's disease and epilepsy), lung disgreers (e.g. cystic fibrosis, asthma and emphysema), skin disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypetides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, immunosuppressive, hepatic, anabolic, anorectic, anti-alzheimer's, renal, anti-parkinsonian, anti-convulsant, anti-ashmatic, dermatological, osteopathic, vascular, cytostatic, anti-leukaemic, anti-infertility and ophthalmological activities: The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding interleukin 17 receptor like polypeptides, asselli for preventing, diagnosing and treating, e.g. Leukaemia, asthma, disheres, psoriasis and alaucoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-terminal*
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleotides
                                                                                                                                                                                                                                                                                                         Human interleukin 17 (hIL-1) receptor-like cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  of Figure 1 are missing in

Anote-"Vector: pTTT3-Pac; Site_1: ECORI; Site_2: NotI; POlyA-selected mRNA was prepared from unfertilized Xenopus laevis egg. The library was constructed in the vector pTTT3-Pac as described in Bonaldo, M.F., Lennon, G. and Soarse, M.B. Normalization and subtraction: .two approaches to facilitate gene and subtraction: .two approaches to facilitate gene discovery', Genome Research 6:791-806, 1996. The first strand synthesis used a NotI-dTIB primer; double stranded colbas were ligated to ECORI adapters, dilested with NotI, and directionally cloned into:the NotI and ECORI-digested pT7T3-Pac vector. The library contained approximately 7.2 % 10.5 recombinants, with average insert sizes of 1-1.5 kb.*
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Taevis eggs. The library was constructed in the vector privat-page as described in Bonaldo, M.F., Lennon, G and Soares, M.B. wormalization and subtraction: two approaches to facilitate gene discovery', Genome Researce 5.791-806, 1996. The first strand synthesis used a NotI-driB primer; doubles stranded cDNAs were ligated to EcoRI adapters, digested with NotI, and directionally cloned into the NotI and EcoRI-digested private vector. The library contained approximately 7.2 x 10.5 recombleants, with average insert sizes of 1-1.5 kb."

gactagttctagatcgcgatcgcgacGGCGCcctttttttttttttttt. Second strand DNA was synthesized by E. coli DNA polymerase I in combination with E. coli RNAse H and E. coli DNA ilgase. Double stranded cDNA was ligated with Sali adapter. These CDNAs were cloned into the Sali/Noti site of pBluescript KS+ and transformed into E. coli Electromax DH10B by
                                                                                                                                                                                                                                                                                                                                                                                                                                                       /dev_stage="bud to 10 somite stage embryos"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
           /note-Vector: pBilasscript SK-; Site_1: EcoRI; Site_2:
Xhoi; cDRN was prepared from 2ug of poly A+ RNA (equal
parts from stage 10.5 and stage 11.5 gastrulae).
ECORI-Xhoi cut cDRN was then ligated into Unizap-XR
(Stratagene) with EcoRI at the 5' end and XhoI at the 3'
end. SS-library phagemids were prepared by mass excision
from the original library and normalized by hybridization
from the original library and normalized by hybridization
ECN to Cot-omega of 11. After removal of hybrids and
excess driver by streptavidin sepharose chromatography,
the ss-phagemids were made double stranded and
electroporated into Top-10 F'. Original library
contruction by Bruce Blumberg (Cho et al. 1991 Cell 67,
111-1120). Note: This is a Amnopus Gene Collection (XGC)

Score

Result

The invention relates to an isolated cytokine receptor polypeptide designated Zcytoris The Zcytoris polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psoriasis or tumour growth. The encoding nucleic acids are useful for providing zcytoris in vivo by gene therapy techniques. Exptoris oliponucleonide probes are useful for in vivo diagnosis, and the Zcytoris probes and primers can be used to detect and localize Zcytoris quesa xaberrations in chomosomes. The probes are also useful for detecting gross xaberrations in chomosomes in which Ecytoris gene resides. The Zcytoris polynuclegatides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a human Zcytoris amino acid sequence. endogenous zcytor18 growth, and modulating immune system by binding to Claim 1; Page 2; 119pp; English.;

The invention relates to an isolated cytokine receptor polypeptide designated Scytoria, The Scytoria polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psortials or tumour growth. The encoding nucleic acids are useful for providing Scytoria in vivo by gene therapy techniques. Scytoria oligonucleotide probes are useful for in vivo diagnosis, and the Scytoria probes and primers can be used to detect and localize Scytoria gene expression in tissue asmiles. The probes are also useful for detecting gross aberrations in chromosome 3 in which scytoria gene resides. The Scytoria polygnucleotides can also be used in linkage-based testing of pulmonary alvoolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a

The invention relates to an isolated cytokine receptor polypeptide designated Expressed by standard recombinant methodology. The polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with poorlasis or tumour growth. The encoding nucleic acids are useful for providing Scytorial in vivo by gene therapy techniques. Exptorial goligonucleotide probes are useful for in vivo diagnosis, and the Zcytorial probes and primers can be used to detect and localize Zcytorial gone expression in tissue asmiples. The probes are also useful for detecting gross aberrations in chromosome 3 in which inkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with pulmonary and erythroleukemia associated with human applymorphisms of cytokine receptors. The present sequence represents a

Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psorlasis and glaucoma 

## claim 20; Page -; 158pp; English.

The invention describes novel nucleic acids encoding interleukin (IL) 17

receptor like polypeptides useful as vaccines and in gene therapy. These
have immunomidulatory, anti-inflammatory, anti-diabelic, anti-inforbial,
have immunomodulatory, anti-inflammatory, anti-diabeliaer's, renal,
anti-parkinsonian, anti-convulsant, anti-asthmatic, dermatological,
costeopathic, vascular, cytostatic, anti-leukemic; anti-infertility and
optional activities. The IL-17 receptor like nucleic acids and
proteins may be used to prevent and treat diseases associated with
inappropriate IL-17 receptor like polypeptide (ILI/TIP) expression. These
include, for example immune disorders (e.g. inflammation, diabetes and
cransplant rejection), infections (e.g. hepatitis and septicemia),
weight disorders (e.g. anorexia, cachexia and obesity), neuronal
cystuction (e.g. alzheimer's disease, parkinson's disease and epilepsy),
lung disorders (e.g. oystic fibrosis, asthma and emphysema), skin disease
(e.g. eczema and psoriasis), kidney disease (e.g. glomerulonephritis),
ce dystact cancer), reproductive disorders (e.g. infermility and
considerate and atherosocias and hypercalcaemia), vascular disorders
ce stroke and atherosocias and hypercalcaemia), vascular disorders
ce stroke and etherosocias and hypercalcaemia, myeloma and
chreat cancer), reproductive disorders (e.g. infermility and
considers needing restorative therapy. The ILI/Tip may also be used as
cutients needing restorative therapy. The ILI/Tip may also be used as
antigens in the production of antibodies against the proteins and in

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-iablefic, intenal, anti-parkinsonian, anti-convulsant, anti-asthmatic, dermatological, osteopathic, vascillar, cytostatic, anti-iablemers's inti-iableficial, or scallar, cytostatic, anti-iablemers' anti-iableficial, or ophthalmological activities. The IL-17 receptor like nucleic acids and protains may, be used to provent and treat diseases associated with insplant rejection; lee polypeptide (IL) the) expression. These include, for example immune disorders (e.g. inflammation, diabetes and risaplant rejection), infections (e.g. inflammation, diabetes and dysfunction (e.g. Alzhehmer's disease, Parkinson's disease and epilepsy), using disorders (e.g. cystic fibrosis, asthma and emphysema), skin disease (e.g. eczema and psoriasis), kidney disease (e.g.; glomerulonephritis), bone diseases (e.g. cystic fibrosis, asthma and emphysema), vascular disorders (e.g. stroke and abebroscierosis, cancers (e.g.; lufertility and miscariage), bye disorders (e.g.; glomerulonephritis), conference), reproductive disorders (e.g.; lufertility and miscariage), bye disorders (e.g.; glaucoma and retinal neuropathy). The patients needing restorative therapy the ILI7rip may also be used as antigens in the protent of similar nucleic acids in samples and identify patients needing restorative therapy. The proteins and antigens in the proteins and antigens may also the proteins and activity. The antigens in the production of antibodies against the proteins and in activity. The antigens and are proteins and are equalate contains and are equalated and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expression and activity.

When the specification but is based on thuman interleukin 17 (11-17) receptor like protein sequence (AMU99904) and has been created according to information given in claim 18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 3894; DB 22; Length 738;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The Invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial, immunosuppressive, hepatic, anabolic, anti-iastimer's, renal, anti-parkinsonian, anti-convulsant, anti-iastimatic, dermatological, osteopathic, vascular, cytostatic, anti-iastimatic, dermatological, osteopathic, vascular, cytostatic, anti-iastimatic, dermatological activities. The IL-17 receptor like moteled acids and proteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like polypeptide (IL)71p) expression. These include, for example-immune disorders (e.g. inflammation, diabetes and transplant rejection), infections (e.g. inflammation, diabetes and cransplant rejection), infections (e.g. inflammation, diabetes and cransplant rejection), infections (e.g. inflammation, diabetes and cyting disorders (e.g. alzeinemer's disease, parkinson's disease and epilepsy), uniquidisorders (e.g. alzeinemer's disease, parkinson's disease and epilepsy), clung disorders (e.g. stroke and atherossierosis, and hypercalcaemis), vascular disorders (e.g. stroke and atherossierosis, cancers (e.g. infertility and breast cancers), respectorises and retinal neuropathy). The productive disorders (e.g. infertility and presence of constants and its complements may also used as disquostic probes to detect and quantitate the presence of similar nucleic acids in samples and identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             patients needing restorative therapy. The ILI7rip may also be used as antigens in the production of antibodies against the proteins and in assays to identify modulators of expression and activity. The anti-ILI7rip antibodies and antagonists may also be used to down regulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: This sequence is not given in the specification but is based on the human Interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 19.
                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 ASRNSGLYNITFKYDNCTTYLNPVGKHVIADAQNITISQYACHDQVAVTILWSPGALGIE 120

ð 윱 ö 윱

The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-inflammatory, anti-diabetic, anti-microbial, immunosuppressive, hepatic, anabolic, ancectic, anti-alzheimer's, renal, anti-parkinsonian, anti-convulsant, anti-asthmatic, dermatological, osteopathic, vascular, cytostatic, anti-ieukaemic, anti-infertility and ophthalmological activities. The IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like polypeptide (IL/7\*Ip) expression. These include, for example immune disorders (e.g. inflammation, diabetes and

Weight disorders (e.g. anorexia, cachexia and obesity), neuronal dysfunction (e.g. Alzahemer's disease, Parkinson's disease and epilepsy).

Lung disorders (e.g. cystic fibrosis, asthma and emphysema), skin disease (e.g. eccema and psoriasis), kidney disease (e.g. glomerulonephritis), bone diseases (e.g. stoopcrosis and hypercalcaemia), vascular disorders (e.g. stroke and atherosclerosis, cancers (e.g. leukemia, myeloma and breast cancer), reproductive disorders (e.g. infertility and expression and activity.

Note: This sequence is not given in the specification but is based on the human interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 24. patients needing restorative therapy. The ILI7rip may also be used as antigons in the production of antibodies against the proteins and in assays to identify modulators of expression and activity. The anti-ILI7rip antibodies and antagonists may also be used to down regulate miscarriage), eye digorders (e.g. glaucoma and retinal neuropathy). The DNA and its complements may also used as diagnostic probes to detect and quantitate the presence of similar nucleic acids in samples and identify ASRNSGLYNITEKYDNCTTYLNPVGKHVIADAQNITISQYACHDQVAVTILWSPGALGIE 120 121 FLKGFRVILEELKSEGRQCQQLILKDPRQLNSSFKRTGMESQPFLNMKFETDYFVKVVPF 180 107 FLEGFRVILEELKSBGRQCQQLILKDPRQLNSSFRRTGMESQPFLNMKFETDYFVKVVPF 166 PSIKNESNYHPFFFRTRACDILLQPDNIACKPFWKPRNINISQHGSDMQVSFDHAPHNFG 240 LKPVHSPWAGPIRAVAITVPLVVISAFATLFTVMCRKKQQENIYSHLDEESSESSTYTAA 360 420 1 MAPWIQICSVFFTVNACINGSQLAVAAGSGRAWGVDTCGWR-----GVGP 46 9 hepatitis and septicaemia), PRFFYLHYKLKHEGPFKRKTCKOEQTTETTSCLLONVSPGDY I JELVDDTNTTRKVMHYA MAPWLOLCSVFFTVNACLNGSQLAVAAGGSGRARGADTCGWRMKAAARPRLCVANEGVGP LPRERLRPRPRVFLCYSSKDGQNHMNVVQCFAYFLQDFCGCEVALDLWEDFSLCREGQRE Ouery Match 96.9%; Score 3890; DB 22; Length 738; Best Local Similarity 97.5%; Pred. 2 Isolated antigenic human or mouse DNAX receptor subunit-like polypeptide useful for detecting antibodies generated in response presence of increased protein levels or immunological disorders -

Claim 1; Page 25; 148pp; English.

The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies applied DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents the human DCRS8 polypeptide.

The sequence is PRO20026 which is the human Interleukin 17 receptor, II-77RH, encoded by DNA 154095-2998. A composition containing ant/agonists to the PRO polypeptides or individual components containing ant/agonists to the PRO polypeptides or individual components on treating a mammal with an immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, independent inflammatory myopathy. Sjogren's syndicone, systemic sclerosis, an indipendent inflammatory myopathy. Sjogren's syndicone, systemic vasculitis, ascrodosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated skin disease, a demyelinating disease, an autoimmune or immune-mediated skin disease, an alternatitis, an allegic disease e.g. food hypersensitivity, asthma, a transplantation associated disease, or a chronic inflammatory demyelinating polyneurogathy. Treating a degenerative cartilaginous disorder comprises manner. Numerous examples of the diseases and disorders are given in the specification. 602 SQPFLNMKFETDYFVKVVPEPSIKNESNYHPFFFRTRACDLLLQPDNLACKPFWKPRNLN 220 ETTSCLLONVSPGDYIIELVDDTNTTRKVMHYALKPVHSPWAGPIRAVAITVPLVVISAF 327 567 DEEPDWFEKQFVPFHPPPLRYREPVLEKFDSGLVLNDVMCKPGPESDFCLKVEAAVLGAT:627 GPADSQHESQHGGLDQDGEARPALDGSAALQPLLHTVKAGSPSDMPRDSG1YDSSVPSSE: 687 688 · LSLPLMEGLSTDQTETSSLTESVSSSGLGEEEPPALPSKLLSSGSCKADLGCRSYTDEL 747 42 RMKAAARPRICVANE-GVGPASRNSGLYNITFKYDNCTTYLNPVGKHVIADAQNITISQY 100 VQCFAYFLQDFCGCEVALDLWEDFSLCREGQREWVIQKIHESQFIIVVCSKGMKYFVDKK 447 NYKHKGGGRGSGKGELFLVAVSAIAEKLRQAKQSSSAALSKFIAVYFDYSCEGDVPG1LD 507 Query Match 92.3%; Score 3703; DB 22; Length 728; Best Local Similarity 96.7%; Pred. (AMGE-) AMGEN INC.

Jing S;

WPI; 2001-611392/70. N-PSDB; AAS16201 Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukaemia, asthma, diabetes, psoriasis and glaucoma

Claim 2; Fig 1; 158pp; English.

The invention describes novel nucleic acids encoding interleukin (IL) 17

The invention describes novel nucleic acids encoding interleukin (IL) 17

The invention describes useful as vaccines and in gene therapy. These have immunomodulatory, anti-inflammatory, anti-diabetic, anti-diabetic, anti-microbial, immunosuppressive, hepatic, anabolic, anorectic, anti-alzehmer's, renal, anti-parkinsonian, anti-convulsant, anti-sathmatic, dermatological, osteopathic, vascular cytostatic, anti-leukaemic, duti-infertility and optoteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like polypeptide (IL17rp) expression. These incide, for example immune disorders (e.g. inflammation, diabetes and transplant rejection), infections (e.g. hepatitis and septicaemia), weight disorders (e.g. anorexia, cachexia and obesity), neuronal dysinction (e.g. Alzhelmer's disease, Parkinson's disease and epilepsy), cup disorders (e.g. oystic fibrosis, asthma and emphysema), skin disease (e.g. stroke and atherosclerosis, asthma and emphysema), skin disease (e.g. stroke and atherosclerosis, cancers (e.g. quantility and business (e.g. stroke and atherosclerosis, cancers (e.g. infertility and miscariage), eye disorders (e.g. infertility may also be used as miscariage), eye disorders (e.g. infertility may also be used an autigens in the production of antibodies against the proteins and in assays to identify modulators of expression and activity. This is the amino acid sequence of human continuelle and anterestion and activity. This is the amino acid sequence of human continuelle decoration of interleughed in the production of interleugh of the production of the protein described in the method of interleugh of the program of the protein described in the production of an expression and activity. This is the amino acid sequence of human continued to the program of the production of an expression and activity the production of acid and acceptor interleughed to the program of a production of acid and acceptor inter

```
The invention relates to an isolated cytokine receptor polypeptide designated Ecytor18. The Ecytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with portasis or tumour growth. The encoding nucleic acids are useful for providing Ecytor18 in vivo by gene therapy techniques. Ecytor18 oligonucleotide probes are useful for in vivo diagnosis, and the Ecytor18 probes and primers:can be used to detect and localize Ecytor18 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which Ecytor18 gene resides. The Ecytor18 polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a murine Ecytor18 amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ilgand

ON protein - protein search, using sw model

Scoring table: BLOSUM62 Gapext 0.5

112892 seqs, 41476328 residues Searched:

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_40:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                      -i--FUNCTION: Receptor for IL17. Binds its ligand with low affinity, suggesting that additional components are involved in IL17-induced signaling (By similarity).

-i- SUBCELLUIAR LOCATION: Type I membrane protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                77 YI----NLSVSSTQHGELVPVLHVEWTLQTDASILYLBGAELSVLQLNTNERLCVKFQF 131
